

New Idea – Extending Concrete Class

Mr. Neat
Java

Lab

- Add a private variable *size* to your BikeWPerson class
- *size* adjusts the size of the person
- Change at least one constructor allowing the client (starter file) to select the size of the person
- Make necessary changes to the BikeWPerson toString() method to include the size information
- Test your code by constructing at least two BikeWPerson objects that have very different sized persons.
- Recycle the BikeWPerson objects. Also, SOP the BikeWPerson objects

Hints

Make sure you assign the *size* variable a default value for the constructors that don't have *size* as a parameter.
