New Idea –
Extending Concrete Class

Mr. Neat
Java

Lab

- Make a BikeWPerson class

- Extend your Bicycle class

- Inherit your Bicycle toString method and augment it to include a person

- Test your code by constructing one object from the new class and recycling it. Also, SOP a BikeWPerson object

Hints

Don't look inside your Bicycle.java file to figure out where to put your person relative to the Bike. You should only use accessor methods from your Bicycle class to get this information. It may be that you need to edit your Bicycle.java file in order to have access to information about the Bike.
