Review: Strings, Text

Mr. Neat
Java

Lab

- In this lab
    - ask the user for a single word (store it in a String variable)
    - Determine the width of each letter
    - Output the letter and its width to the command window

Hints

- Use substring to extract each letter individually
- Store each letter in its own Text variable
- Use the Text method getWidth() to determine the letter's width
